

ENTREPRENEURS FIRST

OakReader

The **NotebookLM** that should exist.

Your AI library for thinking, research, and writing.

NotebookLM proved the category.

Google showed the world that **AI + your documents** is magic.
But they also showed everything that's wrong with it.

- Locked to Gemini — you can't choose your model.
- Cloud-only — your data lives on Google's servers.
- Limited formats — no EPUB, no browser capture, no real workflow.
- No API, no extensibility — a walled garden with no exits.

NotebookLM is a demo of the future. OakReader is the product.

OakReader: NotebookLM, done right.

A **Thinking Partner** that turns your documents into structured knowledge **any AI** can reason over.

LOCAL-FIRST

Your data never leaves your device. Period.

MODEL-AGNOSTIC

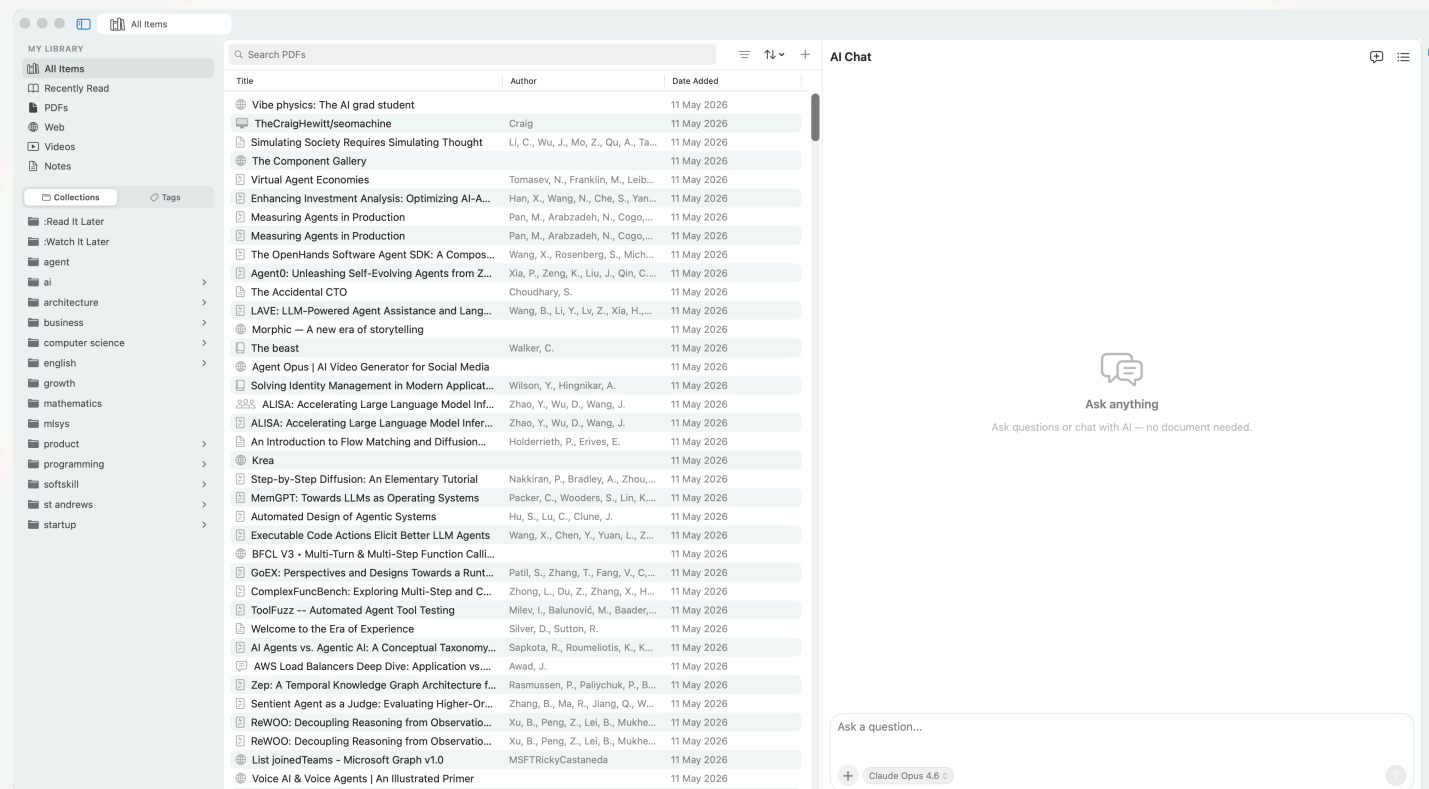

20+ providers. Use the best model for each task.

EXTENSIBLE

Skills, plugins, browser extension. Open by design.

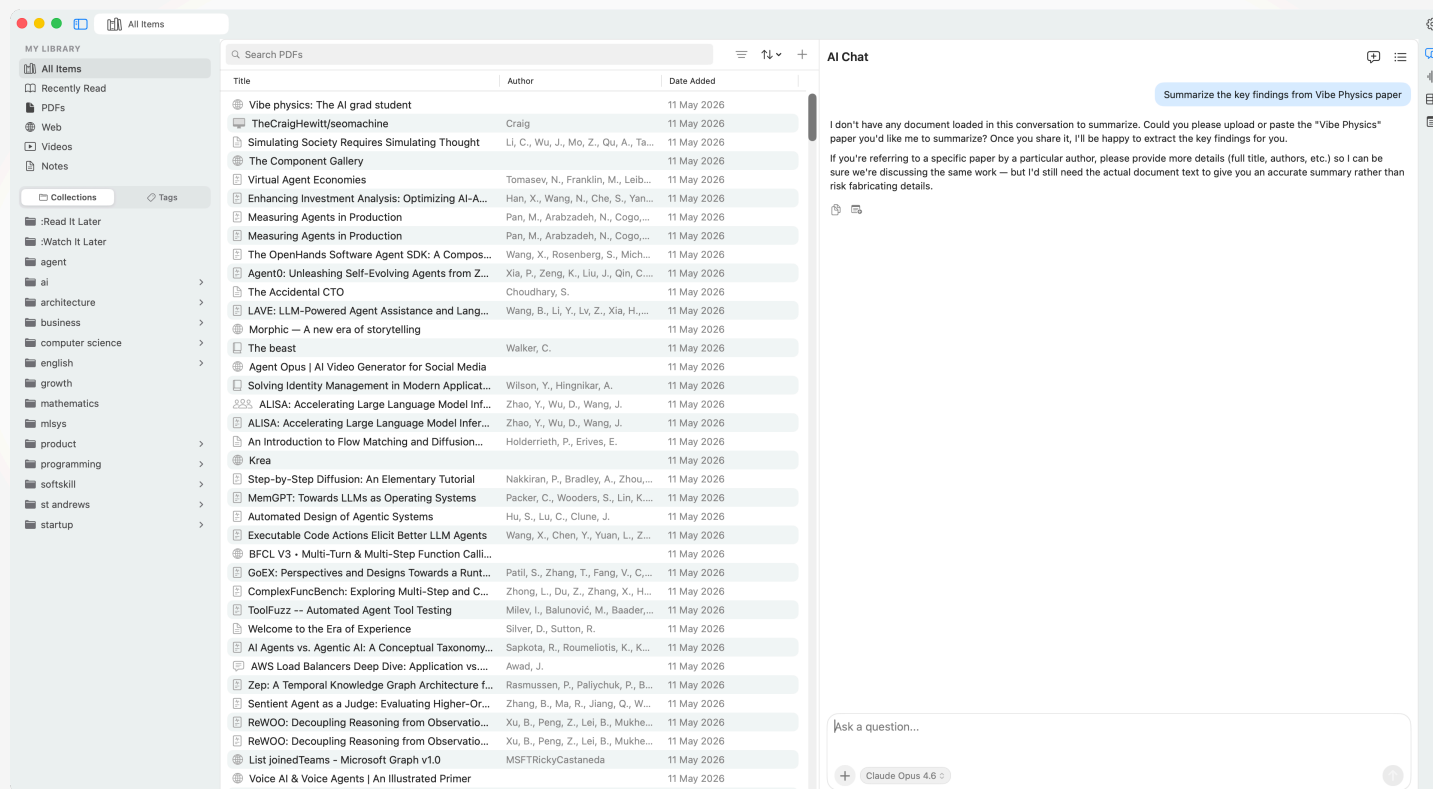

Your AI Library

Collect, organize, and reason over everything you read.

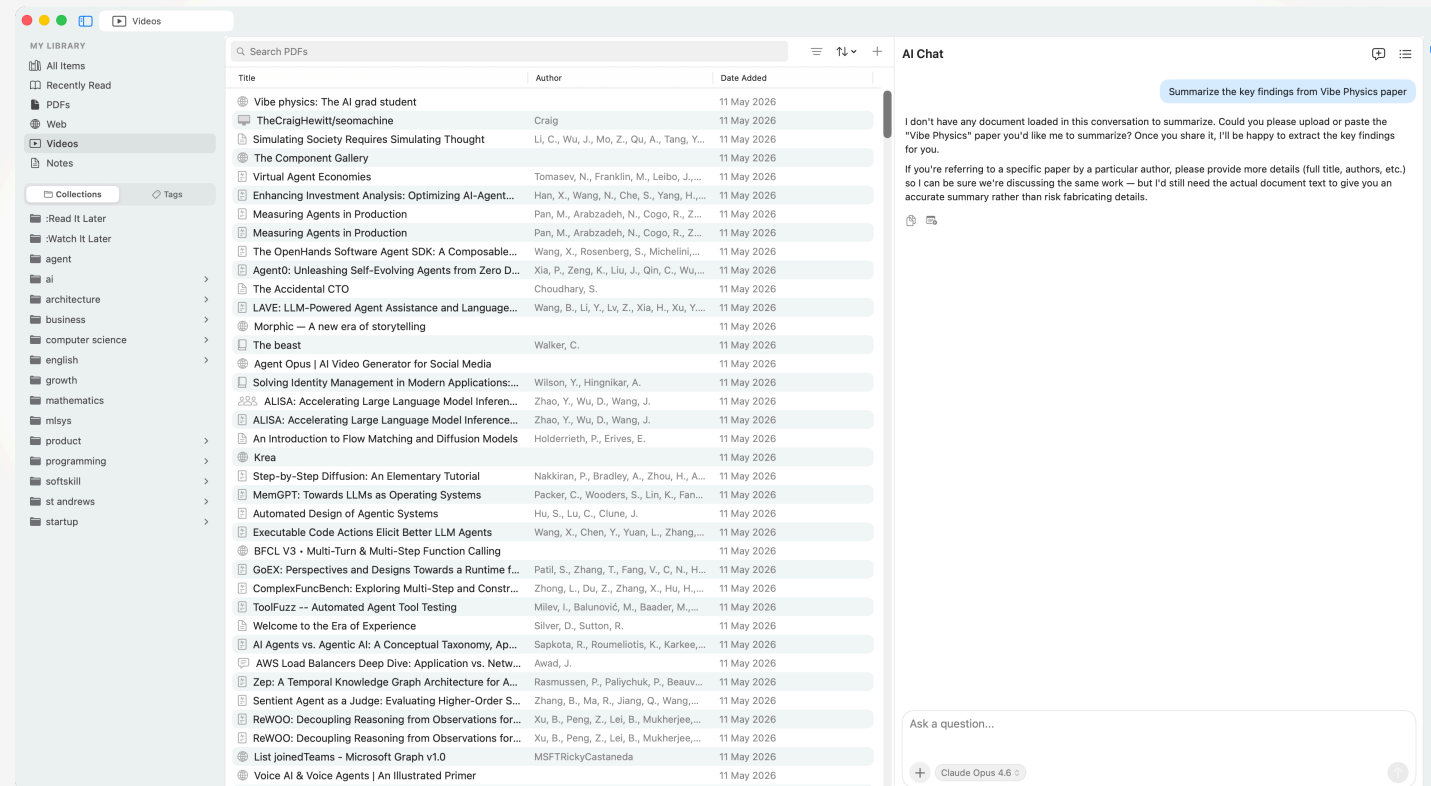

Ask, Don't Search

AI chat across your entire library — powered by any model you choose.

Every Format, One Library

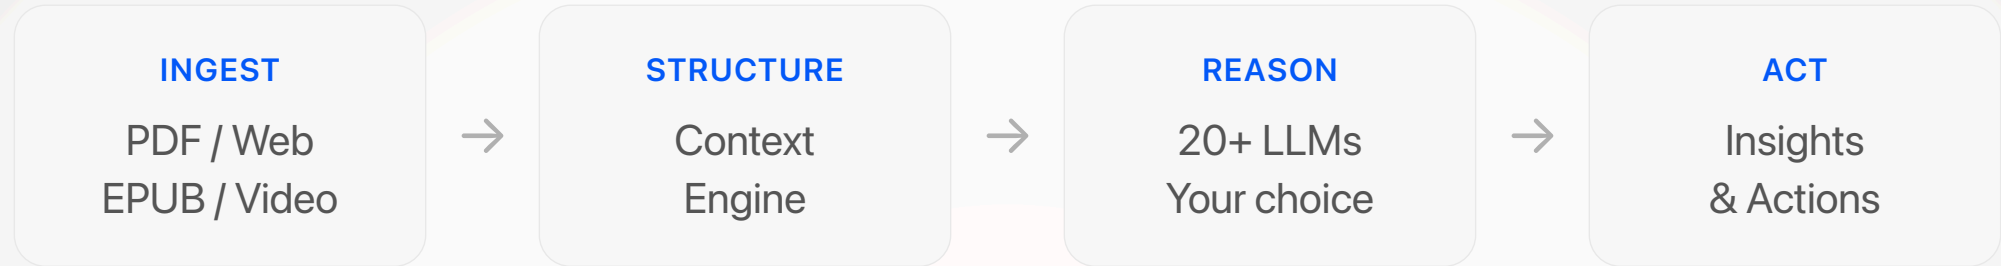

PDFs, web clips, videos, and more — all organized with collections and tags.

Head to Head

	NOTEBOOKLM	OAKREADER
AI Models	Gemini only	20+ providers
Data privacy	Google Cloud	Local-first
Formats	PDF, Docs, Web	PDF, EPUB, Web, Video
Voice	Audio Overview	Live voice agent
Extensibility	None	Skills + browser ext.
Platform	Web only	Native macOS/iOS

How It Works

One unified context layer between your knowledge and any AI model.

Why Now

NotebookLM has **100M+ users**. Google proved the demand.

But users are already hitting the walls:

- Researchers need model choice — Gemini isn't always best.
- Enterprises can't send sensitive docs to Google Cloud.
- Power users need extensibility — not a locked-down web app.

The market is educated and frustrated. They know what they want — they just can't get it from Google.

Market

\$120B

TAM — Knowledge
Management

\$18B

SAM — AI-Augmented Reading

\$800M

SOM — Power Readers &
Researchers

NotebookLM proved the category. Notion (**\$10B**) proved knowledge workers pay.
OakReader sits at the intersection — **AI reasoning + your documents + model freedom.**

Build Time

1

Builder

- Full native macOS/iOS app — production-quality, not a prototype.
- Architecture designed for cloud sync from day one.
- Browser extension with WebSocket JSON-RPC bridge — shipped.

Speed is the signal. This is week two.

Why Me

- **Solo full-stack builder** — Swift, AI/ML, Web, systems architecture.
- **Extreme execution speed** — 298 files in 10 days, shipping daily.
- **Deep domain expertise** — studied every competitor: Zotero, NotebookLM, Readwise, Notion, Pocket, Omnivore.
- **User zero** — I built this because I needed it. Every design decision comes from real pain.
- **Technical moat** — native performance, local-first architecture, model-agnostic design that ages well.

I don't just understand the problem. I've already built the solution.

THE ASK

Applying to **Entrepreneurs First.**

Looking for a cofounder to scale this vision.
The product exists. The market is proven.
Now it's time to build the company.
